PR○LUTION

Personal Privacy Solution Integrated
with Blockchain

We have developed the Prolution project embedded in the Blockchain ecosystem and distributed ledger to resolve two fundamental problems in our everyday lives.

Communicating and transferring holdings around the world that requires trustless security and privacy without any kinds of third parties.

Abstract

The Prolution is represented as an easily accessible Blockchain system promoting the state-of-the-art edition of the digital wallets for transferring Fiat Currency and Encrypted data in just minutes eliminating third parties, any delays, or submitting extra KYC which requires extra resources from the client's side.

Understanding the vitality of how much confidentiality and privacy mean for every one of us, our team has built a secure, decentralized, and fungible system with a trustless privacy solution. With Prolution, you are allowed to have full access and take control over your communicational freedom and also pave your way to financial freedom to run businesses, make payments, send/receive invoices, etc. Thus, only you take and hold the responsibility of your Prolution tokens, Payments, and browsing proceedings.

Blockchain smart contracts help the Prolution to make each and every transaction encrypted, legitimate, immutable, and verifiable in advance, only the sender and receiver will be able to access the proper transaction with the private keys.
As a decentralized ecosystem, the Prolution uses highly sophisticated cryptographic technology to develop our project to validate and deliver the transaction without revealing its sensitive details.
Transactions are fully Anonymous, Confidential, Immutable, and Untraceable

PR●LUTION

Our Goal and Approach

Today, in the era of state-of-the-art technologies, where almost everything and everyone can be tracked and spied on, you have to be invisible and protect your privacy and confidentiality.

Therefore, our mission and goal are to establish and develop a decentralized communication and financial approach (where no sensitive information will be required, or in an exceptional case will be safely stored in the blockchain system) specifically for anonymity, privacy, and untraceability.

Removing central authorities from the view eliminates the vulnerability to hacking, censorship accessibility, and organized intervention. In advance, Prolution holds the leverage in the name of Blockchain to resolve major network privacy issues, build and provide a better, safer, and healthy environment for people to communicate and transfer holdings with 100% accuracy and privacy.

We are determined to establish Prolution as a prominent privacy platform and ecosystem which will be entirely developed around security, privacy, untraceability, and exchangeability. Offering an obscured network, Prolution guarantees that anything that takes place on the platform is done eliminating third parties regardless of their hierarchy of authority.

Why Do People Choose Prolution?

We have been studying and researching the market thoroughly for years and tried to explore something that would combine almost every priority for people that was crucial for them to feel safe when transacting the values and communicating with one another through the network. So we finally built a Unique Prolution Application with an outstanding value proposition.

Here are some key pillars:

- Completely Decentralized ecosystem and Distributed ledger;

- Highly-Sophisticated Privacy Solution;

- Cryptographic encryption with VPN network;

Where Can I Find The Use Of Prolution Wallets?

-Executing anonymous and instant peer to peer payments;

-Sending/receiving untraceable invoice payments with Private Key;

-Issuing self-destructive P2P encrypted messages;

-Annualized 5% fixed deposit interest;

-Mining Prolution tokens directly from the APP;

Executive P2P Payments

P2P payments take place when people transact their holdings in online mode with the help of private banking, credit accounts, mobile banks, and digital money(in our case). It is publicly known that lack of fungibility is what keeps BTC and other similar cryptocurrencies to gain the highly desirable Digital Cash position.

At the same time, the Prolution shows up with its solution, Privacy Blockchain, which by default is the definition of DC (Digital Cash).

We aim our payments to be instant, P2P, untraceable, and encrypted via using advanced technology making it impossible to trace back financial transactions.

Untraceable Invoice Payments

Anonymously paying for services online is one of the essential steps for your digital privacy. Some incognito payments can be done both online and offline. However, many can only be available with an active internet connection. Understanding the ways of paying online without leaving any traces is crucial for keeping your privacy off the record.

As a privacy payment method, it is significantly important for the merchants to have the ability to send and issue payment notes automatically without having to leave the Prolution network.

This is how our invoice payment system works: you just simply request a payment exactly as you do regularly. You will be provided with the QR code or Pay invoice option, then invoice information will be filled automatically for the client who will authenticate the payment with the wallet key provided upfront.

Self-Destructive P2P Encrypted

The innovative idea of the blockchain ecosystem allowed communities to securely and privately run the P2P financial proceedings right on the spot. At this moment, our project is offering a leading Blockchain Encrypted messaging system by pushing the blockchain applications even harder.

Our Encrypted messaging system works like a regular Google, WhatsApp, or Messenger application and allows users to simply edit and send private messages to their friends. However, here comes the major difference between the aforementioned applications and our system. The Prolution is a built-in application in the decentralized Blockchain ecosystem which is very singular and as a privacy solution, it is significant to highlight that our messaging system has the self-destruct option which will automatically wipe out the messages from the blockchain to guarantee advanced privacy and confidentiality.

Annualized 5% Fixed Deposit Interest

The Prolution is a project which uses the combination of Proof of Work (PoW) and Proof of Stake (PoS), allowing clients to protect the system by authenticating and verifying the blocks as holders or miners. Staking PRLN tokens on our blockchain ecosystem is as simple as fixed bank deposits. You simply initiate the amount of the PRLN tokens you would like to deposit, choose the staking timeframe and verify the deposit.

The network will automatically evaluate the interest amount to be claimed by the end of the staking period and give you the approximate date of Deposit Maturity. Holder/Staker can withdraw initiated deposits with interest and either Re-Stake or spend the PRLN tokens at the maturity period.

Deposit terms vary from 0.4% a month up to 5% per

PRL Token Wallet Built-in Mining

Prolution Proof of Work blockchain by its nature relies on the system miners to maintain and secure the blockchain. To put it in simple terms, the more miners working on the network the better it gets for clients. It serves the purpose of developing the blockchain which will be fully decentralized where we will be able to integrate the CPU-less PRLN software directly to Main Wallet.

Mining the tokens does not require any extra knowledge, effort, or equipment. Choose the Mining section, indicate the number of Cores to allocate on the mining section, and select the desired pool you want to start mining in. No matter how big or small you are on the system and how much you contribute to the network, we still strongly recommend participating in the mining pool, because you will be able to mine PRLN tokens with as little as 1 CPU core.

Mined tokens will be automatically transferred to the main wallet.

How Do I Claim Prolution Coins?

Prolution coins are Utility Tokens that we allude to as the fuel necessary to cover the transaction execution fees on Prolution Blockchain.

Here we demonstrate three possible ways of getting Prolution Tokens:

1. Wallet Built-in Mining;

2. Purchasing on Public Exchange Platforms;

3. Top up your wallet on the Blockchain and create new Prolution coins as a reward to secure the Prolution Blockchain system. Very similar to Fixed Deposit, here as well you will get 5% interest a year payable as early as monthly terms 0.4% a month.

Is the Prolution Project Owned By Anyone?

Removing central authorities from the view eliminates the vulnerability to hacking, censorship accessibility, and organized intervention. In advance, Prolution holds the leverage in the name of Blockchain to resolve major network privacy issues, build and provide a better, safer, and healthy environment for people to communicate and transfer holdings with 100% accuracy and privacy.
